Foodborne Infections and Intoxications: Chapter 13. Streptococcal Disease (Food Science and Technology) J. Glenn Morris

Streptococci (specifically, Lancefield group A streptococci, or *Streptococcus pyogenes*) are among the most common bacterial causes of pharyngitis. The microorganism is generally transmitted by respiratory droplets, fomites, or direct contact with infected skin lesions. However, streptococci can also be transmitted by food, with infected persons developing signs and symptoms of pharyngitis; CDC has estimated that there are over 10,000 such cases annually in the United States. In reported outbreaks infected food handlers have generally been the source of contamination, and there is often a history of poor or inadequate refrigeration of the implicated food. While recent foodborne outbreaks have been primarily associated with group A streptococci, illness has also been associated with group C and G strains, and there are suggestions that strains in other Lancefield groups can be transmitted by food or animal contact.
